Clinical predictors of prolonged mechanical ventilation after cardiac surgery. To identify predictors of prolonged mechanical ventilation (PMV) in patients undergoing cardiac surgery. Prospective cohort study. University hospital. All patients undergoing cardiac surgery with cardiopulmonary bypass (CPB) from February 1, 2006 to February 29, 2007. None. The main outcomes were PMV duration and the occurrence of ventilator-associated pneumonia (VAP). After the univariate analysis, only 5 predictors were found to be significantly related to PMV duration: (1) obesity (body mass index > 30); (2) high mean arterial blood pressure (MAP > 105 mm Hg); (3) respiratory rate (RR > 20 breaths/min); (4) hematocrit (Hct > 30%), and (5) mini-mental test (MMT > 23). Those 5 predictors were entered in the multivariate model that included cardiopulmonary bypass time (CPB time) and ventricular dysfunction. Finally, only 2 predictors were found to be significantly related to PMV duration, which were cardiopulmonary bypass time and MMT (p Monday, July 7, 2012 "I'm sure that many of you have come across people who have said one of two things about vaccines: 1) they are dangerous and should not be used; or 2) they are good and should always be used.
